

Hungry... or just sleep deprived?

Late-night snacking is often a cry for rest,
not a cry for calories. Let's look at the science.

DHRUTHI WELLNESS

Poor sleep changes
your appetite.

A photograph of a dark wooden bowl filled with a mix of snacks including potato chips, pretzels, and nuts. The bowl sits on a white marble countertop. In the background, a person's hand is visible holding a fork, and a copper pot sits on the counter. A window is visible on the left side of the frame.

Somnic State
Circadian Disruption

Neural Signals
Hormone Shift

Appetite Drive
Increased Cravings

When sleep goes down, cravings go up...

@DhruthiWellness

The Sleep-Appetite Cycle

Less Sleep

Increased Hunger

Intense Cravings

Less sleep triggers ghrelin (hunger) and suppresses leptin (fullness).
Your brain demands quick energy, leading to high-carb cravings.

The Wellness Solution

Resetting your biological baseline

7–9 Hours Sleep

Allows endocrine balance & reset

Better Mood

Reduces emotional & stress eating

Better Food Choices

Naturally favors clean nutrition

More Energy

Increases daily physical activity

Better Health

Strengthens metabolism & immunity

DHRUTHI WELLNESS

Sleep Better.
Eat Smarter.
